# Introduction

### Copyright

This functional description is subject to the legal requirements for copyright protection and may not be, either in whole or in part, photocopied, reprinted, or reproduced by mechanical or electronic means, or in any other manner be duplicated or redistributed without the legally binding, written agreement of

Janitza electronics GmbH, Vor dem Polstück 1, D 35633 Lahnau, Germany,

### Trademarks

All trademarks and their resulting rights belong to the respective holders of these rights.

### Disclaimer

Janitza electronics GmbH takes no responsibility for errors or defects within this functional description and takes no responsibility for keeping the contents of this operating manual up to date.

### Comments on the manual

We welcome your comments. In the event that anything in this manual seems unclear, please let us know and send an EMAIL to: info@janitza.de

Follow the instructions in the operating manual when installation and operating the device!

### Meaning of the symbols

The following pictograms are used in the operating manual at hand:

### Dangerous voltage!

Danger to life or risk of serious injury. Disconnect system and device from power supply before beginning work on them.

## Caution!

Please follow the documentation. This symbol warns of possible dangers that can arise during installation, commissioning and use.

### Note

# Mode of operation of the "Tariff Switch" app

- You can use the "Tariff Switch" application to switch between up to 4 different tariffs on the master and slave devices (up to 31 slaves).
- Switching takes place via the controller for the digital outputs, Modbus register address #2000 or via a time control.
- The master device checks which tariff is to be activated and switches to this itself and on the slave devices that are set.

The following slave devices can be used: UMG 103, UMG 104, UMG 604, UMG 605, UMG 508, UMG 511, UMG 96RM

# Integrate Power Analyser into the GridVis

To integrate the Power Analyser into the GridVis evaluation and configuration software an Ethernet connection must be established to the device and the TCP/IP address defined.

- Establish a connection between the PC and the device (see connection example) via a direct connection or via a switch/router. It is recommended to use CAT5 cable.
- Determine or set the addressing mode ("fixed IP" or "DHCP"). If "fixed IP" mode is selected then set the TCP/IP address of the device.

Fig. Example connection: Integration into a network with DHCP server. UMG and PC are assigned their IP addresses automatically from a DHCP server.

Switch

Patch cable

### **Fixed IP address**

In simple networks without a DHCP server, the network address has to be set directly in the device.

With a direct PC-UMG connection, note:

• Use a crossover patch cable.

Patch cable

 The first three segments of the IP addresses for the device and the computer should be identical. The last segments must be different! The subnet mask must match in all four blocks.
 Example:

Computer's IP address:	192.168.000.020 with the subnet mask: 255.255.255.0
UMG's IP address:	192.168.000.021 with the subnet mask: 255.255.255.0

### **DHCP** mode

DHCP allows for the fully automatic integration of a UMG into an existing network without additional configuration. When started, the UMG automatically obtains the IP address, the network mask and the gateway from the DHCP server.

### Attention

The connection of the UMG to an existing Ethernet network may only be carried out after discussion with the network administrator!

### Integrating the UMG 604 / 605

- Change the device to programming mode. To do so press buttons 1 and 2 simultaneously for approx. 1 second. With the password query deactivated the programming mode is then started and identified with the text "PRG". The first digit of the address flashes.
- Set the address 205 for the selection "DHCP-Modus" (=2) or "Fixed IP address" (=0).
  - To do so, use button 2 to set the first digit to the value 2. Then switch to the second digit with button 1 and set it to a value of 0 with button 2. Set the third digit to a value of 5 in the same way.
  - Once the address is set, switch to the setting with button 1. Use button 2 to set the parameter to the corresponding value (cf. "Addressing mode" table).
  - For further settings use button 1 to go back and enter the next address.
  - If no button is actuated for ca. 60 seconds, or if buttons 1 and 2 are pressed simultaneously for ca. 1 seconds, then the device exits programming mode and changes back to display mode.

Address	Description				
205	DHCP mode				
	0 = Fixed IP	1 = BootP	2 = DHCP client	3 = Zeroconf	Table: Addressing mode

- With the selection of "Fixed IP address", other additional network parameters must be set:
  - Setting the device IP address
    - Change to programming mode. Set the address 300 as described and set the first three digit block of the device IP address (cf. IP addresses table).
    - Then set the address 301 and allocate the second block of the device IP address.
    - Complete the entries with the addresses 302 and 303.
  - Setting the subnet mask
    - Set the subnet mask, using the same method as for configuring the device IP address, with addresses 304 to 307 (cf. IP addresses table).
  - Setting the standard gateway
    - Set the standard gateway (if present), in the same way as the IP address, with addresses 310 to 313 (cf. IP addresses table).
    - Note: Gateway adjustment is normally not required for the configuration.
- Read out the device address with "DHCP mode" selection:
  - Change to the programming mode as described. Set the address to 300, using buttons 1 and 2 and note down the three digit block in the Contents area. Carry out the same step for addresses 301 to 303 (cf. table under step 10).

Address	Description	Address	Description		Address	Description
300	IP address, xxx	304	IP mask,	XXX	310	IP gateway, xxx
301	IP address, xxx	305	IP mask,	xxx	311	IP gateway, xxx
302	IP address, xxx	306	IP mask,	xxx	312	IP gateway, xxx
303	IP address, xxx	307	IP mask,	XXX	313	IP gateway, xxx

Table: ID addresses

### Integrating the UMG 508 / 511

- Start the configuration menu from the home display with button 1 ("ESC"). Change to the "Communication" entry with button 3 and open this with button 6.
- Similarly to above, set the selection to "DHCP". To do so mark the "DHCP" entry and open this via button 6. Select the corresponding entry "DHCP" or "Off" with button 3 or 4 and confirm this with button 6. Deactivate the entry in the case of networks without DHCP servers ("Off").
- With the DHCP mode deactivated ("Off") further network parameters must be set:
  - Setting the device IP address
    - Select the entry "Address" with button 3 or 4 and open this with button 6. Change the first digit of the address via button 3 or 4. Then switch to the second digit with button 5 and set this in a similar manner to above. Complete the IP address and confirm the entries with button 6.
  - Setting the subnet mask
    - Select the entry "Netmask" with button 3 or 4 and open this with button 6. Set the subnet mask in a similar manner to the setting of the IP address for the device.
  - Setting the standard gateway
    - Select the entry "Address" with button 3 or 4 and open this with button 6. Set the IP address for the Standard Gateway (if present) in a similar manner.
    - Note: Gateway adjustment is normally not required for the configuration.
- Reading out the device address:
  - Start the configuration menu from the home display with button 1 ("ESC"). Change to the "Communication" entry with button 3 and open this with button 6.
  - Note the addresses under "Address" and "Netmask".

### Setting the IP address of the computer for a direct connection

PCs on company networks normally use DHCP. If you would like to assign a fixed IP address for the PC (e.g. for a direct PC to UMG connection), proceed as follows:

### Attention

Settings in a company network can vary.

### Attention

The connection of the UMG to an existing Ethernet network may only be carried out after discussion with the network administrator!

- Open the Network and Sharing Center in the Windows Control Panel.
- Open the status window via the LAN connection (fig. Network and Sharing Center).
- By selecting "Properties", it is possible to assign a fixed IP address to the PC (see fig. Process for defining a fixed IP address under Windows 7).

### Insert the device in the GridVis software

- Open the GridVis software and load or create a project.
- Open the "Device" node in the project window and activate the context menu for the "Device" node with a right click of the mouse.
- Select the "Add new device" context menu item (cf. fig. Add new device).

Fig.: "Add new device"

• Select the type of device, listed under the device category, and confirm the selection with "Next".

Steps	Choose File Type	
1. Choose File Type 2	Project: gridVis	
	Categories: Data Logger Weters and PQM devices E. Energy Meter EM Series E. Energy Meter ECS Series Generic Modbus Virtual Devices	File Types: UNG 505 UNG 507 UNG 507 UNG 508 UNG 509 UNG 510 UNG 511 UNG 511 UNG 512 UNG 604 UNG 605 UNG 605 UNG 605US UNG 605US

Further information on using the GridVis software can be found in the internet at: https://wiki.janitza.de/display/GRIDVIS70EN/GridVis-Documentation+7.0

# Installing the "Tariff Switch" app

• To install the app, launch the GridVis software. Click on "Tools / Install app" and use the "..." button to select the app. Then select the master device that is connected to GridVis for installation and select a program location.

# Configuring the "Tariff Switch" app

- Enter the IP address for the Power Analyser into the address bar of the web browser (Windows Internet Explorer, Firefox etc.). As soon as a connection has been established with the Power Analyser, the web server of the device appears.
- Start the app configuration by selecting the "Configuration" menu and then "Tariff Switch".

### Selecting options: Digital input 1 or 2

- When you select the "*Digital input 1*" or "*Digital input 2*" option, you must set the configuration for digital input switching.
  - You can switch between tariff 1 and tariff 2 when controlling via the digital inputs.
  - Choose between the "High signal tariff 1 low signal tariff 2" and the "high signal tariff 2 low signal tariff 1" options.
  - Choose "Save" to complete configuration.

### Selecting options: Modbus address

- If you select the "Modbus address" option, you must set the switch values for register address 20000.
  - For each tariff, specify a value at which the appropriate tariff is to be activated.
  - The specified value must be sent to Modbus address 20000 to ensure that the tariff is switched.
  - Choose "Save" to complete configuration.
